

STI TESTING AND PASS FACT SHEET

FOR ADULT PERFORMERS

The standard PASS panel includes a blood and urine test, which screen for 7 STIs

Chlamydia

Trichomoniasis

Syphilis

HIV

Hepatitis C

Gonorrhea

Hepatitis B

PASS provides a database that producers and performers both can access online, which shows **ONLY** your status, **NOT** your personal information, to protect performers' medical privacy

The adult industry requires performers to get this panel within **14 days** of shooting any scene involving fluid transfer. If the results are not all negative, the performer may not shoot

In the event of a positive result, the performer gets treatment, and may not work again until they re-test negative. Their scene partners are also informed and treated

HOWEVER, IF THERE IS A POSITIVE HIV RESULT

the entire adult industry is put on a production hold, for everyone's safety, until they can isolate and determine the source of the virus

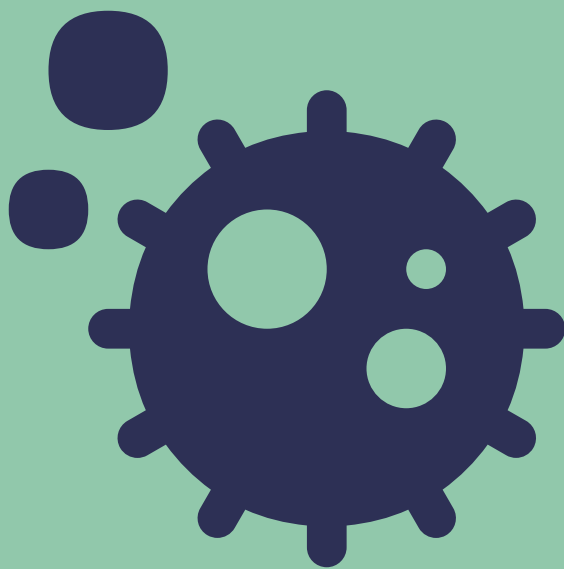

performers with a confirmed HIV positive test are no longer able to be included in PASS

HIV FACTS

The HIV test the adult industry uses is a qualitative RNA PCR test, known as an HIV-1 NAT test

It is superior to those used at most clinics because it can detect the viral load as soon as HIV becomes transmissible, in 9-14 days. The other test can take months to detect the virus

UNDETECTABLE = UNTRANSMITTABLE

If an individual with HIV is taking their medication as directed, and has gotten down to an undetectable level, they can not pass HIV to another person

PrEP
Pre-exposure Prophylaxis

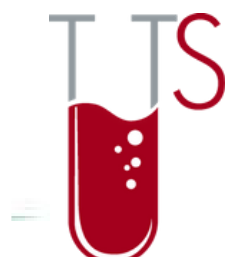

PrEP (brand name Truvada) is a drug that a high-risk individual, such as one dating an HIV positive partner, can take to prevent contracting the virus
